

HOW SPOT MONITORING HELPS YOU MANAGE YOUR IT ASSETS

October's SPOT Topic
From The Fulcrum Group

INVENTORY

Quickly and easily obtain a summary inventory of your desktop/laptop computers, including information such as make, model, last user logged in, CPU/memory/disk, operating system, and warranty expiration.

This information can be exported to an Excel spreadsheet at any time, and can be the basis for asset lists or to help you plan for a PC or server refresh. Detailed inventory can also be created showing software installed, history of alerts, and other information as well. These can be used for software/licensing audits or software upgrade planning.

MANAGE

With SPOT Network Monitoring, you can automate the process of deploying Windows patching, deploying software, updating configurations, running scripts, and other processes.

MONITOR

SPOT Network Monitoring can be configured to alert for a multitude of criteria ranging from system down to low disk space to event log errors. And you can decide which alerts automatically create service request tickets to speed up the process of resolution.

REPORTING

SPOT Network Monitoring provides ad hoc and scheduled reporting capabilities that can provide asset and network health reports. SPOT Network Monitoring offers you an IT asset management solution you can count on. SPOT Network Monitoring is included as part of our SPOT Managed IT Services solution and is also available on an a la carte basis.
